Subject Index

A

Air traffic control operations, analysis and optimization of terminal area, 259
Algorithm
  design of LTL driver routes, 280–295
  dynamic traffic assignment model, 119–128
  generative, network cost(s), 27–35
  heuristic, vehicle routing problem, 86–92
  interacting hubs and location-allocation problems, 212–222
  location of discretionary service facilities, 201–211
  network cost(s) from one link's output, 27–35
  Newton-SOR method for spatial price equilibrium, 36–47
  parallel network equilibrium, 59–68
  railroad operations, 263–279
  routing, with tree constraints, 230–245
  simulated annealing, 18–26
  simulation of queueing networks, 296–311, 312–329
  SOR, spatial price equilibrium, 48–58
  time dependent vehicle routing problems, 185–200
  traffic assignment problem, 7–17
  variational problems for moving facility, 330–345
Annealing, simulated, for network design, 18–26
Automated guided vehicle systems, analytical models for design and analysis of, 257–258

B

Benchmark problems, vehicle routing with soft time window, 69–85
Bibliographic Section, 157–160, 355–361
Boolean formulation, simple plant location problem, 138–148
Bottlenecks, "phantom," moving and, 223–229
Bus systems, in heterogeneous environments, analytic optimization of, 256–257

C

Computational results
  design of railroad operation, 263–279
  determination of optimal paths of moving facility, 330–345
  interacting new facilities and location-allocation problems, 212–222
  location of discretionary service facilities, 201–211
  parallel and serial relaxation, 48–58
  time dependent vehicle routing problems, 185–200
  vehicle routing problem with stochastic travel times, 161–170
Crowd behavior and movement, 253–254
Customer selection, stochastic inventory routing, 171–184

D

Disaggregate simplicial decomposition, 4–17
Discretionary service facilities, optimal location of, 201–211
Distance function, new, for modeling travel in transportation network, 129–137
Driver routes, design of regular intercity, for LTL motor carrier industry, 280–295
Dynamic traffic assignment model and solution algorithm, 119–128

E

Equilibrium, operators-users, model in partially regulated transit system, 93–105
Experimental design, simulation of queueing networks, 312–329

F

Frank-Wolfe algorithm, traffic assignment problem, 7–17

H

Hazardous material transportation, modeling real-time decision making for, 255–256

I

In memoriam: Stella Dafermos, 1940–1990, 1
Interacting new facilities and location-allocation problems, 212–222
Inventory routing, stochastic, route design with stockouts and route failures, 171–184

L

Linear weights, path localization, 149–156
Location-allocation problems, interacting new facilities and, 212–222
Location problems
  complexity of classes of, 352–354
  simple plant, Boolean and graph theoretic formulations of, 138–148
Link output and network cost(s), 27–35
LTL motor carrier industry, design of regulatory intercity driver routes for, 280–295

M

Matrix problem, constrained, parallel network equilibration algorithm for class of, 59–68
Medians, parametric, of trees, 149–156
Model
  design of LTL driver routes, 280–295
  dynamic traffic assignment, 119–128
  heuristic for periodic vehicle routing, 86–92
  integer programming, transfer optimization, 106–118
  linear regression, travel distances, 129–137
  moving and "phantom" bottlenecks, 223–229
  multicommodity spatial price equilibrium, 48–58
  nonlinear, Newton-SOR method for spatial price equilibrium, 36–47
  operators-users equilibrium, 93–105
  parametric medians of trees, 149–156
  railroad operations, 263–279
  transfer optimization, transit system, 106–118
  travel distances in transportation network, 129–137
  vehicle routing with soft time windows, 69–85
  vehicle routing with stochastic travel times, 161–170
Moving, "phantom" bottlenecks and, 223–229
Moving facility, optimal paths of, variational problems for determining, 330–345
Multilocation inventory systems with transshipments in response to stockouts, 258

N

Network and routing problems, complexity and worst-case analysis of, 258
Network (costs) from one link's output, 27–35
Network design problem, with variational inequality constraints, simulated annealing approach to, 18–26
Network equilibration parallel, algorithm for class of constrained matrix problems, 59–68
Network equilibrium, introduction to special issue on, 3
Newton-SOR method, for spatial price equilibrium, 36–47

O

Operators-users equilibrium model in partially regulated transit system, 93–105

Optimal paths of moving facility, variational problems for determining, 330–345
Optimal positioning of service units along coordinate line, 346–351
Overrelaxation, parallel and serial, for multicommodity spatial price equilibrium problems, 48–58

P

Parallel network equilibration, algorithm for class of constrained matrix problems, 59–68
Pavement surfaces, model of, 257
"Phantom" bottlenecks, moving and, 223–229
Plant location problem, simple, Boolean and graph theoretic formulations of, 138–148
Public transport systems, method for route-choice problem in, 246–251

Q

Queuing networks, simulation of
  experimental design, 312–329
  methodology, 296–311

R

Railroad operation plans, designing, dual adjustment method for implementing Lagrangian relaxation, 263–279
Route-choice problem, public transport systems, method for, 246–251
Routing
  shipment, with tree constraints, algorithms for, 230–245
  with stockouts and route failures, 171–184

S

Scaling algorithms for multicommodity flow problems and network flow problems with side constraints, 254
Seat allocation, airline network, 259–260
Service facilities, discretionary, optimal location, 201–211
Service units, optimal positioning of along coordinate line, 346–351
Shipment routing algorithms with tree constraints, 230–245
Simple plant location problem, 138–148
Simulated annealing, network design, 18–26
Simulating transient, stochastic queueing networks, numerical methods for
  experimental design, 312–329
  methodology, 296–311
Spatial equilibrium, Newton-SOR for, 36–47
Stockouts and route failures, stochastic inventory routing, 171–184
Successive overrelaxation (SOR), spatial price equilibrium problems, 48–58

T

Time dependent vehicle routing problems, formulations, properties and heuristic algorithms, 185–200
Time window constraints, vehicle routing, 69–85
Traffic assignment model, dynamic, and solution algorithm, 119–128
Traffic assignment problem, simplicial decomposition and disaggregated representation for, 4–17
Transfer optimization in transit network, 106–118
Transit network, transfer optimization, 106–118
Transit system, operator-users equilibrium model in partially regulated, 93–105
Travel distances, in transportation network, new distance function for modeling of, 129–137
Travel times, stochastic, with vehicle routing problem, 161–170
Tree constraints, shipment routing algorithms with, 230–245
Trees, parametric medians of, 149–156

U

Urban transport system, route-choice problem, 246–251

V

Variational problems for moving facility, 330–345
Vehicle allocation problem, stochastic dynamic, dynamic networks with random arc capacities, 252–253
Vehicle routing
  acyclic networks, 256
  and scheduling with soft time window constraints, optimization-based heuristic for, 69–85
  stochastic and dynamic, in Euclidean service regions, 254–255
Vehicle routing problem
  computation experience, 86–92
  periodic, heuristic for, 86–92
  time dependent, formulations, properties and heuristic algorithms, 185–200
  with stochastic travel times, 161–170
